Sustaining Engineering and Project Management for IBM

Project Description

CH2M HILL has provided a variety of engineering services to IBM since the early 1980's and was selected as an IBM Core Supplier in 2000. Our projects for this client have been located in the United States, Europe and Asia. A recent project is the design of the Building 323 Annex (300 mm) at East Fishkill, New York.

In addition to major capital projects, we have performed recurring and nonrecurring A&E design and project management services for IBM Northeast Region since October 2002. During this time we have supported IBM with a scalable resource aligned with the firm's dynamic workload, and have demonstrated our ability to deliver projects that are within budget and schedule compliant. Our scope includes on-site facilities engineering, tool installation, and planning, layouts and studies.

Our site-based teams are supported by regional offices, matching skill sets with the requirements for each task. Work is completed with minimal impact to ongoing adjacent operations.

Highlights

- On-site teams at 3 locations in the Northeast Region
- Provided innovative engineering solutions for unique research building (T.J. Watson)
- Achieved significant savings through code interpretation and negotiations with city
- Provided environmental services and permitting
